This CDS clone is a part of a collection of human full length
expression clones generated by BD Biosciences Clontech and the
Harvard Institute of Proteomics. Each CDS has been cloned in two
forms: with and without stop-codon (to allow fusion with C-terminal
tag). The CDS has been directionally cloned wising BD In-Fusion(TM)
cloning system between the Sall and Hindill sites of the pDNR-DDAL
vector. Additional sequences in the clone: 'ACC' after Sall site
and before 'Hid III site to maintain reading frame.
Clone distribution: http://Dioinfo.clontech.com/orfclones.

                                                          L. Submitted (13-MAY 2003) BD Biosciences Clontech, 1020 East Meadow Circle, Palo Alto, CA 94303, USA This CDS clone is a part of a collection of human full length expression clones generated by BD Biosciences Clontech and the Harvard Institute of Proteomics. Each CDS has been cloned in two forms: with and without stop-codon (to allow fusion with C-terminal tag). The CDS has been directionally cloned using BD In-Fusion(TM) cloning system between the Sall and Hindill sites of the pDNR-DUAL vector. Additional sequences in the clone: 'ACC' after Sall site and before Affic to provide Kozak consensus sequence; 'GG' after last codon and before Hindill site to maintain reading frame. Clone distribution: http://bioinfo.clontech.com/orfclones.
                                                                                                                                                                                                                                                                                                                                                                                                                          1. .>882

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                d
                                                                                                                                                                                                                                                                                                                 This invention describes a novel human prostate-derived serine protease
(PDSP) polynucleotide (also known as Tango 114). The prostate derived
serine protease (PDSP) polypeptide is used to modulate a variety of
cellular processes. It can used to produce fusion proteins. PDSP is used
to treat proliferative disorders, e.g. prostate cancer. The protein may
also be used to produce antibodies, end to identify antagonists and antibodies
can be used to produce antibodies, predictive medicine; and methods of
treatment. PDSP cleaves growth factors, and can be used for the
modulation of growth factor blosynthesis; generation of active peptides,
regulation of growth factor blosynthesis; queration of growth factor
binding proteins; regulation of cellular differentiation; regulation of
metastasis; and regulation of prostate development. The PDSP
metastasis; and regulation of prostate development; to detect PDSP mRNA;
to detect genetic alterations in the PDSP gene; in forensic biology; and
serine protease such as the prostate derived serine protease have important
relular processes, there exists a need for identifying novel
serine protease such as the prostate derived serine protease (PDSP) of
the invention. This sequence encodes the human PDSP-1 described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

                                                 This sequence is a BS247 specific polynucleotide.

The invention relates to a method of detecting the presence of a target BS247 polynucleotide, especially mRNA, in a test sample. BS247 polynucleotides are derived from breast tissue. The polynucleotides, polynucleotides are derived from breast tissue. The polynucleotides, polynucleotides are useful for providing information leading to the detection, diagnosis, staging, monitoring, prognosis, in vivo imaging, prevention or treatment, determining predisposition to, diseases and conditions of the breast, such as breast cancer, atypical hyperplasia, fibroadenoma and cystic breast disease. Drug treatment or gene therapy for breast cancer, can be based on these identified gene sequences and the efficacy of any particular therapy can be monitored. The BS247-derived reagents are advantageous for detection of breast cancer due to their specificity. The reagents also provide an alternative, non-surgical diagnostic method capable of detecting early stage breast disease, such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GlnTrpLeuLeuThrAlaAlaHisCysArgLysLysValPheArgValArgLeuGlyHis 120

This sequence is a BS247 specific polynucleotide.

The invention relates to a method of detecting the presence of a target
The invention relates to a method of detecting the presence of a target
SS247 polynucleotide, especially mRNA, in a test sample. BS247
polynucleotides are derived from breast tissue. The polynucleotides,
polynucleotides are useful for providing information leading
to the detection, diagnosis, staging, monitoring, presponsis, in vivo
imaging, prevention or treatment, determining predisposition to, diseases
and conditions of the breast, such as breast cancer, atypical
on therapy for breast cancer, can be based on these identified gene
sequences and the efficacy of any particular therapy can be monitored.
The BS247-derived reagents are advantageous for detection of breast
cancer due to their specificity. The reagents also provide an
alternative, non-surgical diagnostic method capable of detecting early
stage breast disease, such as cancer.
                                                                                                                                                                                                                                               260

The gene number is given in the descriptor line. The gene can be used to generate fuusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. Aa206210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: Aa206219-206263; amino acid sequences AA218386-Y38498) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypucleotides. Specific uses are described for each of the 36 the condition that the new polypucleotides. Specific uses are described for each of the 36 the condition are as a second of the 36 the acid of acid of the 36 the acid of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           polynucleotides, based on which tissues they are most highly expressed (see AA20619 for described uses).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated human genes and the secreted polypeptides they encode

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This DNA encodes a human keratinocyte derived protease (KDP) polypeptide. The protease is substantially similar to a sequence encoded by the inserin plasmid FERM BP-6129. The KDP polypeptide, from human keratinocytes, is specifically used in skin care products, particularly to treat or prevent skin flaking, e.g. dandruff, and in laundry detergent compositions. More generally the KDP polypeptide can be used in any

ectides, based on which tissues they are most highly expressed in
                                                                                                       This sequence represents a nucleic acid molecule which encodes a secreted human protein. The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin FC portion (e.g. AA206210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: AA206219-206263; amino acid sequences AAX08386-Y38498) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations the new polypuclocities. Specific uses are described for each of the 36
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ThrValProSerGlySerAsnGlnAspLeuGlyAlaGlyAlaGlyGluAspAlaArgSer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           903
 homologs and antibodies
           can be used in screening assays; predictive medicine; and methods of treatment. PDSP cleaves growth factors, and can be used for the modulation of growth factor biosynthesis; generation of active peptides; regulation of cellular proliferation; degradation of growth factor binding proteins; regulation of cellular differentiation; regulation of metastasis; and regulation of prostate development. The PDSP polynocleotides can be used to express the protein; to detect penetic alterations in the PDSP gene; in forensic biology; and as a source of primers and probes. As serine protease have important roles in cellular processes, there exists a need for identifying novel serine protease such as the prostate derived serine protease (PDSP) of the invention. This sequence encodes the human PDSP-1 described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences by recombinant to the preparation of PRO polypeptides, especially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAS21244-AAS21518 encode for novel human secretory and transmembrane
PRO polypeptides. The PRO polypeptides are useful to detect other
PRO polypeptides, to link bloactive molecules to cells expressing
PRO polypeptides, to modulate biological activities of cells expressing
PRO polypeptides, and to detect the presence of mammalian lung, colon,
breast, prostate, rectal, cervical or liver tumours by comparing PRO
Dolypeptide expression in a cell sample to that in a control sample.
Come of the 275 sequences are also useful to stimulate the release of
tumour necrosis factor-alpha (TNF-alpha) from human blood, the
proliferation or differentiation of chondrocytes, the proliferation or
gene expression in periorte cells, the release of proteoglycans from
cartilage, the proliferation of inner ear utricular supporting cells or
of T-lymphocytes, the release of a cytokine from peripheral blood
monocytes (PBMCs), or the proliferation of endothelial cells. Some of
the PRO polypeptides may modulate glucose or free fatty acid uptake by
skeletal muscle cells or by adipocytes; or inhibit binding of A-peptide
to factor VIIA. The PRO polypeptides can be used in assays to identify
molecules involved in binding interactions. The polynucleotides encoding
PRO polypeptides can be used to generate probes, antisense RNA/DNA,
transgenic or knock out animals and can be used in gene therapy.

proteins. The PROP proteins have evideatatic and transmeasurants from proteins. The PROP proteins have evideated ectivity. The PRO proteins can be used for targeted delivery of bioactive molecules, such as can be used eat leach. PRO nucleotide sequences, and their fragments, can be used as hybridisation probes, in chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used to develop and screen therapeutically useful reagents. The PRO nucleotide and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AFK44270 to AFK44470 represent PRO primers and hybridisation probes used in the isolation of human PRO sequences. AAF444087 to AAR65300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention. The present invention describes human secreted and transmembrane PRO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                    The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for inking bloactive molecules to cells expressing PRO polypeptides, and for for identifying agonists or antagonists.

The PRO polypeptides are useful for for stimulating the release of tumour necrosis factor (TRF)-alpha from human blood, for stimulating the proliferation or differentiation of chondrocytes, and detecting the presence of tumours. The polynucleotide sequences encoding PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, for the genetic analysis of individuals with genetic encoding the human PRO polypeptides, for generating transgenic animals or encoding the human PRO polypeptides of the invention.

```

The invention relates to an isolated nucleic acid comprising, or which is at least 80% identical to, or the full-length coding sequence of, any of the 275 nucleotide sequences, encoding the corresponding PRO polypeptide (one of 275 secreted or transmembrane proteins). The nucleic acid curder American Type Culture Collection (ATCC) accession number in a list given in the specification. Also included are vectors and host calls for producing PRO proteins, PRO fusion proteins, anti-PRO antibodies, PRO extracellular domains and mature sequences, methods of detecting PRO proteins, methods for stimulating the release of TNF-alpha (tumour necrosis factor alpha) from human blood, and the proliferation of differentiation of chondrocyte cells, the release of proteoglycans from cartilage, proliferation of inner ear urticular proteoglycans from cartilage, proliferation of inner are urticular proteoglycans from cartilage, proliferation of relaying the release of proteoglycans from propheral blood monouclear cells, the release of a cytokine from peripheral blood monouclear cells, the release of proteoglycans from peripheral blood monouclear cells, the release of a cytokine from peripheral blood monouclear cells, the release of proliferation of endothelial cells), a method for modulating the optimation of a tumour in a mammal and an oligonoucleotide probe derived from any of the nucleotide sequences cited above. The nucleic acids and cited above. The nucleic acids are useful as hybridisation of diabetic complications. Ald and an oligonoucleotide propertion probes, in chromosome and gene mapphag, and in generating antisense RNA or DNA. The polypeptides are useful as planmaceuticals, diagnostics, blosensors or blosensors or blosensors or blosensors are useful as PRO protein of the invention. New secreted and transmembrane nucleic acids and polypeptides, designated as PRO, useful for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature Gao W; DeForge L, Desnoyers L, Filvaroff E, Ga A, Godowski PJ, Gurney AL, Sherwood S; Tumas D, Watanabe CK, Wood WI, Zhang Z; Sequence 1570 BP; 332 A; 485 C; 424 G; 329 T; 0 other; Length:

3 Gao s; Deforge L, Desnoyers L, Filvaroff E, A, Godowski PJ, Gurney AL, Sherwood S Tumas D, Watanabe CK, Wood WI, Zhang Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in included a broactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insulficiency disorders. PRO1164 and PRO1186 constituents are pro1186, pro828, pro828, pro826, pro828, pro826, p disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO813 and PRO11066 induce proliferation of mammalian kidney mesangial cells, and therefore are useful for treating kidney disorders associated with decreased mesangial cell function such as Berger disease or other nephropathies associated with dermatitis, herpetiformis or Crohn's disease. PRO1310, PRO814, PRO1312, PRO1192 and PRO1313 induce the proliferation and/or redifferentiation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This

Novel isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 and PRO1375, which stimulate proliferation of stimulated T-lymphocytes are therapeutically useful for enhancing immune response and in cancer treatments

# Example 99; Page 259; 648pp; English.

The invention describes an isolated human PRO polypeptide. The PRO bolypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO

useful for treating cardiac insufficiency disorders. PRO1154 and PRO5186 stimulate adrenal cortical capillary endothelial growth, and PRO536, PRO943, PRO828, PRO826, PRO1066, PRO943, PRO828, PRO828, PRO826, PRO943, PRO828, PRO828, PRO828, PRO828, PRO828, PRO828, PRO828, PRO8186 and PRO1387 induce c-fos in endothelial cells, and are thus useful for treating conditions or disorders where angiogenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are useful for treating cancerous tumours. PRO812 inhibits vascular endothelial growth factor (VEGF) stimulated proliferation of endothelial cells growth in mammals which would be beneficial in inhibiting tumour growth. PRO826, PRO1068, PRO1184, PRO1346 and PRO1375. stimulate proliferation of Estimulated T-lymphocytes and are therapeutically useful for tenhancing immune response. PRO826, PRO826, PRO1068 or PRO1132 enhances survival/proliferation of retinal neurons cells (PRO1132 is also enhances survival/proliferation of rod photoreceptor cells) and therefore are useful for treating retinal disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO813 and PRO8106 induce proliferation of mammalian kidney mesangial cells, decreased mesangial cell function such as Berger disease or other rephyshology experience are useful for treating herbetiformis or Crohn's disease. PRO8131, PRO8132, pRO8132 induce the polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO1154 and PRO1186 proliferation and/or redifferentiation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This sequence represents a primer used in the isolation of DNA encoding lovel human PRO polypeptides \$
